The *p*-center problem: Definition

Definition

- Given
  - a set V of locations,
  - $p \in \mathbb{Z}$, and
  - distances d_{ij} from location $i \in V$ to $j \in V$

The *p*-center problem: Definition

Definition

- Given
  - a set V of locations,
  - $p \in \mathbb{Z}$, and
  - distances d_{ij} from location $i \in V$ to $j \in V$
- we want to
  - open *p* locations of V, such that

The *p*-center problem: Definition

Definition

- Given
  - a set V of locations,
  - $p \in \mathbb{Z}$, and
  - distances d_{ij} from location $i \in V$ to $j \in V$
- we want to
  - open *p* locations of V, such that
  - the maximum distance of any location to its closest opened location is minimized.

# The nesting property

The nested *p*-center problem

The nested *p*-center problem: Definition I

- given a set of customer demand points $\mathcal{I}$,
- potential facility locations $\mathcal{J}$,
- time periods $\mathcal{H} = \{1, \ldots, H\}$,
- integers $\mathcal{P} = \left\{ p^1, \ldots p^H \right\}$
  - where $p^h \leq p^{h+1}$ for $h = 1, \ldots, H-1$ and
  - $p^H \leq |\mathcal{J}|$
- distances $d_{ij} \geq 0$ between each $i \in \mathcal{I}$ and $j \in \mathcal{J}$

The nested *p*-center problem: Definition II

- a feasible solution to the nested *p*-center problem consists of a set $\mathcal{J}^h \subseteq \mathcal{J}$
  - with $\left|\mathcal{J}^h\right| = p^h$ for $h \in \mathcal{H}$,
  - for which $\mathcal{J}^h \subseteq \mathcal{J}^{h+1}$ for $h = 1, \ldots, H-1$ holds
- the goal is to find a feasible solution which minimizes $\sum_{h=1}^{H} d_h(\mathcal{J}^h)$,
  - where $d_h(\mathcal{J}^h) = \max_{i \in \mathcal{I}} \min_{j \in \mathcal{J}^h} d_{ij}$ for $h \in \mathcal{H}$

p-center problem vs nested *p*-center problem
The nested p-center problem: Potential applications

The nested p-center problem: Classical MILP formulation

Mixed Integer Linear Programming formulations

First MILP formulation

Decision variables

$$x_{ij}^h \dots \begin{cases} 1 \dots \text{if customer } i \text{ is assigned to facility location } j \text{ in period } h \\ 0 \dots \text{otherwise} \end{cases}$$

First MILP formulation

Decision variables

$x_{ij}^h \ldots \begin{cases} 1 \ldots \text{if customer } i \text{ is assigned to facility location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

$y_j^h \ldots \begin{cases} 1 \ldots \text{if a facility is opened at location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

First MILP formulation

Decision variables

$x_{ij}^h \ldots \begin{cases} 1 \ldots \text{if customer } i \text{ is assigned to facility location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

$y_j^h \ldots \begin{cases} 1 \ldots \text{if a facility is opened at location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

$z^h \ldots$ maximum distance between any customer i and its nearest open facility in period h

First MILP formulation

$$(\text{nPC1}) \qquad \min \qquad \sum_{h \in \mathcal{H}} z^h \tag{1a}$$

$$\text{s.t.} \qquad \sum_{j \in \mathcal{J}} y_j^h = p^h \qquad \forall h \in \mathcal{H} \tag{1b}$$

$$\sum_{j \in \mathcal{J}} x_{ij}^h = 1 \qquad \forall i \in \mathcal{I}, h \in \mathcal{H} \tag{1c}$$

$$x_{ij}^h \leq y_j^h \qquad \forall i \in \mathcal{I}, j \in \mathcal{J}, h \in \mathcal{H} \tag{1d}$$

$$\sum_{j \in \mathcal{J}} d_{ij} x_{ij}^h \leq z^h \qquad \forall i \in \mathcal{I}, h \in \mathcal{H} \tag{1e}$$

$$y_j^h \geq y_j^{h-1} \qquad \forall h \in \mathcal{H} \setminus \{1\} \tag{1f}$$

$$x_{ij}^h, \in \{0, 1\} \qquad \forall i \in \mathcal{I}, j \in \mathcal{J}, h \in \mathcal{H} \tag{1g}$$

$$y_j^h, \in \{0, 1\} \qquad \forall j \in \mathcal{J}, h \in \mathcal{H} \tag{1h}$$

$$z^h \in \mathbb{R}_{>0} \qquad \forall h \in \mathcal{H} \tag{1i}$$

Second MILP formulation

$$\text{(nPC2)} \quad \min \quad \sum_{h \in \mathcal{H}} z^h \tag{2a}$$

$$\text{s.t.} \quad \sum_{j \in \mathcal{J}} y_j^h = p^h \qquad \forall h \in \mathcal{H} \tag{2b}$$

$$z^h \geq d_{ij} - \sum_{j' : d_{ij'} < d_{ij}} (d_{ij} - d_{ij'}) y_{j'}^h \qquad \forall i \in \mathcal{I}, j \in \mathcal{J}, h \in \mathcal{H} \tag{2c}$$

$$y_j^h \geq y_j^{h-1} \qquad \forall j \in \mathcal{J}, h \in \mathcal{H} \setminus \{1\} \tag{2d}$$

$$y_j^h \in \{0, 1\} \qquad \forall j \in \mathcal{J}, h \in \mathcal{H} \tag{2e}$$

$$z^h \in \mathbb{R}_{\geq 0} \qquad \forall h \in \mathcal{H} \tag{2f}$$

Third MILP formualtion

$\mathcal{D} \ldots$ set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

Third MILP formualtion

$\mathcal{D}$ ... set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

$\mathcal{K}$ ... set of indices in $\mathcal{D}$

Third MILP formualtion

$\mathcal{D}$ ... set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

$\mathcal{K}$ ... set of indices in $\mathcal{D}$

S_i ... set of indices $k \in \mathcal{K}$ for which there exists a facility $j \in \mathcal{J}$ with $d_{ij} = D_k$

Third MILP formualtion

$\mathcal{D}$ ... set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

$\mathcal{K}$ ... set of indices in $\mathcal{D}$

S_i ... set of indices $k \in \mathcal{K}$ for which there exists a facility $j \in \mathcal{J}$ with $d_{ij} = D_k$

Decision variables

$y_j^h \ldots \begin{cases} 1 \ldots \text{if a facility is opened at location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

Third MILP formualtion

$\mathcal{D}$ ... set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

$\mathcal{K}$ ... set of indices in $\mathcal{D}$

S_i ... set of indices $k \in \mathcal{K}$ for which there exists a facility $j \in \mathcal{J}$ with $d_{ij} = D_k$

Decision variables

$y_j^h \dots \begin{cases} 1 \dots \text{if a facility is opened at location } j \text{ in period } h \\ 0 \dots \text{otherwise} \end{cases}$

$u_k^h \dots \begin{cases} 1 \dots \text{if the optimal value of } z^h \text{ is greater or equal than } D_k \\ 0 \dots \text{otherwise} \end{cases}$

Third MILP formualtion

$\mathcal{D}$ ... set of distinct distances where $D_0 \leq \cdots \leq D_K$ are the values in $\mathcal{D}$

$\mathcal{K}$ ... set of indices in $\mathcal{D}$

S_i ... set of indices $k \in \mathcal{K}$ for which there exists a facility $j \in \mathcal{J}$ with $d_{ij} = D_k$

Decision variables

$y_j^h \ldots \begin{cases} 1 \ldots \text{if a facility is opened at location } j \text{ in period } h \\ 0 \ldots \text{otherwise} \end{cases}$

$u_k^h \ldots \begin{cases} 1 \ldots \text{if the optimal value of } z^h \text{ is greater or equal than } D_k \\ 0 \ldots \text{otherwise} \end{cases}$

z^h ... maximum distance between any customer i and its nearest open facility in period h

Third formulation

(nPC3) $\quad$ min $\qquad\qquad \sum_{h \in \mathcal{H}} z^h \qquad\qquad\qquad\qquad\qquad$ (3a)

$$\text{s.t.} \qquad\qquad \sum_{j \in \mathcal{J}} y_j^h = p^h \qquad \forall h \in \mathcal{H} \qquad\qquad\qquad (3b)$$

$$D_0 + \sum_{k=1}^{K} (D_k - D_{k-1}) u_k^h \leq z^h \qquad \forall h \in \mathcal{H} \qquad\qquad\qquad (3c)$$

$$u_k^h + \sum_{j:d_{ij}<D_k} y_j^h \geq 1 \qquad \forall i \in \mathcal{I}, \forall h \in \mathcal{H}, \forall k \in S_i \cup \{K\} \quad (3d)$$

$$u_k^h \geq u_{k+1}^h \qquad \forall h \in \mathcal{H}, \forall k \in \mathcal{K} \setminus \{K\} \qquad (3e)$$

$$y_j^h \leq y_j^{h-1} \qquad \forall h \in \mathcal{H}, \forall j \in \mathcal{J} \qquad\qquad (3f)$$

$$y_j^h \in \{0, 1\} \qquad \forall h \in \mathcal{H}, \forall j \in \mathcal{J} \qquad\qquad (3g)$$

$$u_k^h \in \{0, 1\} \qquad \forall h \in \mathcal{H}, \forall k \in \mathcal{K} \qquad\qquad (3h)$$

$$z^h \in \mathbb{R} \qquad \forall h \in \mathcal{H} \qquad\qquad\qquad\qquad (3i)$$

The (pCP) version of formulation (nPC3) has the best known linear programming ($\mathcal{LP}$)-bounds for the (pCP), while the (pCP) versions of (nPC1) and (nPC2) have equally but worse $\mathcal{LP}$-bounds.

Reducing set $\mathcal{K}$ in (nPC3)

Lemma 1

Let $\underline{z^h}$ be a valid lower bound and $\overline{z^h}$ be a valid upper bound on the decision variable z^h for $h \in \mathcal{H}$, then the distinct distance D_k can only be the optimal distance for z^h if $\underline{z^h} \leq D^k \leq \overline{z^h}$ holds.

Therfore let set $S_i^h \subseteq S_i$ for $h \in \mathcal{H}$, where S_i^h contains only the indices k where $\underline{z^h} \leq D^k \leq \overline{z^h}$ holds and constraint (3d) can be replaced with

$$u_k^h + \sum_{j:d_{ij}<D_k} y_j^h \geq 1 \qquad \forall i \in \mathcal{I}, \forall h \in \mathcal{H}, \forall k \in S_i^h \cup \{K\} \qquad (4)$$

Depending on the bounds $\underline{z^h}$ and $\overline{z^h}$ the sets S_i^h can be much smaller than S_i.

Strengthening constraints (nPC2)

Lemma 2

Let LB_h be a lower bound on the decision variable z_h of (nPC2) for every $i \in \mathcal{I}, j \in \mathcal{J}, h \in \mathcal{H}$ then

$$z^h \geq max\{LB^h, d_{ij}\} - \sum_{j':d_{ij'}<d_{ij}} (max\{LB^h, d_{ij}\} - max\{LB^h, d_{ij'}\})y_{j'}^h \qquad \text{(nL-OPT)}$$

is a valid inequality for (nPC2), i.e., every feasible solution of (nPC2) fulfills (nL-OPT)*. Theorem is based on Lemma 5 in Gaar and Sinnl (2022).*

A similar strengthening can be done for (1e) in fromulation (nPC1).

Obtaining bounds I

Lemma 3

Let z'^{h*} be the optimal objective function value of (pCP) with $p = p^h$ for $h \in \mathcal{H} = \{1, 2, \ldots, H\}$ where $p^h > p^{h+1}$, then $UB = Hz'^{1*}$ is a valid upper bound on the optimal objective function value of (npCP).

Then

$$\overline{z^h} = \frac{UB - \sum_{x=h+1}^{H} z'^{x*}}{h+1}$$

where $\overline{z^h}$ is a valid upper bound on the decision variable z^h of the (npCP) for $h \in \mathcal{H}$.

Obtaining bounds II

Lemma 4

Let z'^* be the optimal objective function value of (pCP) for a certain p'. Then z'^* is a valid lower bound $\underline{z^h}$ on the decision variable z^h of (npCP) with $p^h = p'$.

Implementation and outline of the results

Implementation

- Implemented in C++ using the CPLEX API of CPLEX 20.1.0.0
- Formulation (nPC2) solved by branch-and-cut and seperation based on the customers
- Preprocessing for all formulations
  - solving the (pCP) for p^h, $h \in \mathcal{H}$ starting with $h = H$
  - p^h is a valid lower bound for the (pCP) with p^{h-1}
- Single core of an Intel Xeon X5570 machine
  - 2.93 GHz
  - 48 GB RAM
  - Each run limited to 9 GB RAM and 3600 sec

Data

- data set PMED from "A note on solving large p-median problems" by Beasley (1985)
  - set of 40 test instances
  - the sets contain between 100 and 900 nodes
  - number of facilities to open initially ranging from 5 to 200
  - $\mathcal{P} = \{p, p + 1, p + 2\}$

Data

- data set PMED from "A note on solving large p-median problems" by Beasley (1985)
  - set of 40 test instances
  - the sets contain between 100 and 900 nodes
  - number of facilities to open initially ranging from 5 to 200
  - $\mathcal{P} = \{p, p + 1, p + 2\}$

- data set TSPLIB 2D-Euclidean distances from "TSPLIB—A Traveling Salesman Problem Library" by Reinelt (1991)
  - set of 80 test instances
  - the sets contain between 51 and 1002 nodes
  - rounded to the nearest integer value
  - $\mathcal{P} = \{4, 5, 6\}$

Technology Transformation

Managerial insights
(i) Relative regret

(j) Relative regret of # of facilities

Figure: On a subset of instances: Only if the problem was solved to optimality

Conclusion

- (nPC3) had the best runtimes over all instances
- For optimality gap the results are rather mixed
- The (nPC2) outperforms the (nPC1)
- Maximal relative regret of the objective value of 15%
- Maximal relative regret of number of facilities above 140%
- min-max regret as objective function was also analysed and can be found later in the thesis
